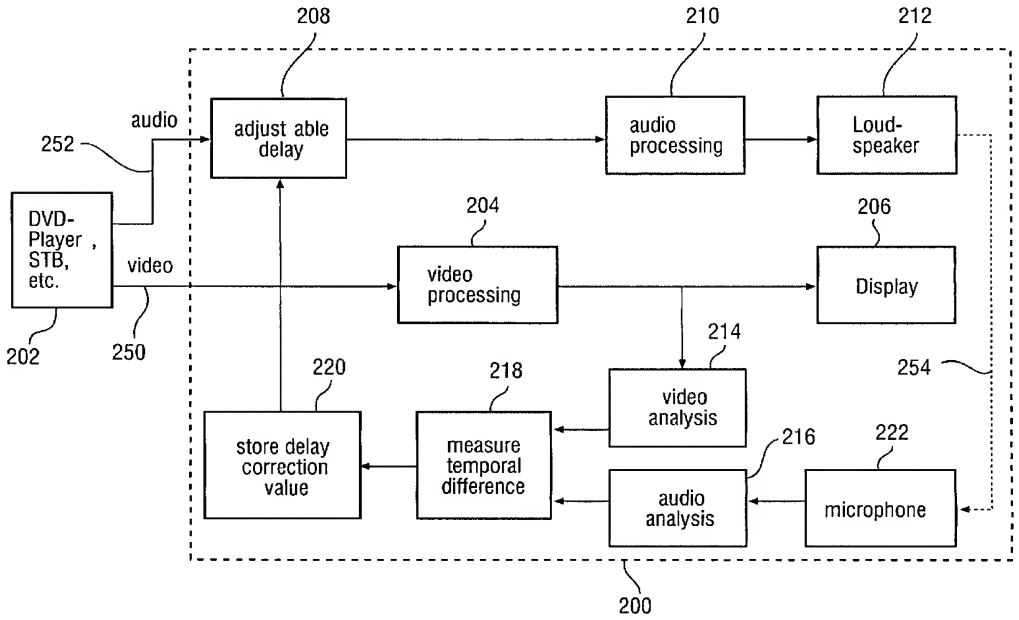
(54) Title: VIDEO-AUDIO SYNCHRONIZATION



(57) Abstract: Visual and aural output from an audiovisual system (100, 200, 300) are synchronized by a feedback process. Visual events and aural events are identified in an audio signal path and a video signal path, respectively. A correlation procedure then calculates a time difference between the signals and either the video signal or the audio signal is delayed in order to obtain a synchronous reception of audio and video by a viewer/listener.
